PROFILE

Aspiring Junior Software Developer | Full Stack & AI Enthusiast

I am engaged in project-based work focusing on database architecture, backend development, and AI-driven development. I aim to advance my career by combining the hands-on experience I have gained in industry projects with modern technologies (Python, C#, SQL).

You can find more details about my technical methodology and project history on my personal website.

EDUCATION

Computer Programming (Associate Degree)

Ostim Teknik Üniversitesi

09/2024 – Present

Ankara

GPA : 3.23/4.00 (Currently)

PROFESSIONAL EXPERIENCE

Software Development & Biometric Data Management System Intern

T.C. İçişleri Bakanlığı - Nüfus ve Vatandaşlık İşleri Genel Müdürlüğü

01/2026 – 05/2026

Ankara

Collaborated cross-functionally with the NVİ backend team, BVYS database administrators, and Havelsan system engineers. Contributed to web test automation and system monitoring tools, and participated in Backend Core API development. Gained hands-on experience by directly executing Bash/sh scripts and .sql operations in a Linux environment.

Biometric Data Management System Intern

T.C. İçişleri Bakanlığı - Nüfus ve Vatandaşlık İşleri Genel Müdürlüğü

09/2025 – 12/2025

Ankara

Worked within the database layer of the BVYS project to learn the management of public-scale large datasets. Gained hands-on experience in database operations using PostgreSQL and pgAdmin 4. Participated in daily operational processes where I witnessed and learned how to implement security best practices, including SQL injection prevention.

E-Commerce Operations Support

Başgimpa Gıda İht. Madd. Tic. Ltd. Şti. MARKETTEN

2024 – 2025

Ankara

Conducted 3 months of field and retail operations across various periods. Analyzed the practical application of corporate ERP and e-commerce software in a real-world environment and gained insights into on-site user experience.

PROJECTS

AIRSENSE | IoT Project

Sectoral Project Manager

11/2025 – Present

I developed and managed the full technical lifecycle of the AIRSENSE IoT platform. I built and managed the mobile interface with React Native and the backend services using Python and FastAPI. Additionally, I constructed and managed the database architecture using Supabase and PostgreSQL while personally implementing and managing the integration of embedded system processes in C++.

MIXCODDER Inventory Tracking ERP / OTU

Sectoral Project Manager

09/2025 – Present

I coordinated the end-to-end management of the MIXCODDER ERP system using Trello and modeled complex business workflows through BPMN diagrams. Throughout the project, I oversaw the entire development lifecycle, including backend architecture and database (DB) control, while personally designing the User Interface (UI) to ensure both functional and aesthetic alignment.

WEB-AUDIT | Browser-Based Auditing

02/2026 – 04/2026

Backend Developer Intern

I developed and managed the core engine of WEB-AUDIT, a browser-based web application auditing tool. I built and managed the automated scanning scenarios using Playwright and TypeScript to analyze security headers, network errors, and accessibility signals. I constructed and managed the PostgreSQL job store architecture and queue worker systems to handle scalable audit tasks and data retention. Additionally, I implemented and managed the generation of JSON artifacts and CI/CD integrations to provide systematic technical risk reporting.

WEB-MONITOR | Uptime & Performance Monitoring

02/2026 – 03/2026

Backend Developer Intern

I developed and managed WEB-MONITOR, a local, self-hosted asynchronous HTTP/HTTPS monitoring platform designed for private data centers to eliminate third-party SaaS dependencies. I built and managed the asynchronous monitoring engine using Python, FastAPI, and aiohttp, implementing AIMD-based concurrency control to handle high-throughput polling without overwhelming target services. I constructed and managed the SQLite (WAL mode) data layer and YAML/TXT configuration systems to ensure efficient data persistence and easy target management. Additionally, I implemented and managed Prometheus metric exports, a local NOC dashboard, and Docker Compose deployments to provide a fully isolated and production-ready observability stack.

Raven | Flight Control & Envelope Protection Simulation

01/2026 – 01/2026

Independent Developer

Developed a simulation to explore flight control laws and safe envelope protection, focusing on defense industry software principles.

Simple-Radar-Sim | Radar Logic Simulation

01/2026 – 01/2026

Independent Developer

Built a software project to model and visualize fundamental radar working principles and system logic.

Raven Eyes | Automated Threat Tracking Simulation

01/2026 – 01/2026

Independent Developer

Developed and managed a simulation using OpenCV for detection and servo motors for automated tracking and alignment.
